

Readout agreement, response validity, and target ranking

All 14 model/bank cells retained · ties and invalid generations remain explicit · conservative equal-value ranks

P = canonical probability C = whole-answer canonical argmax G = parsed unconstrained greedy completion

Rank colors: P blue, C purple, G orange. Markers show conditional ranks; offset segments show full-bank identification ranges. These estimands can differ. Tie sizes count principal means equal to Dahl, including Dahl. Rank 46 can mean a 46-way tie: S1 target C/G are tied across all 46 principals in BOTH banks.

Agreement uses all prompts and disjoint outcome categories. Per-prompt likelihood ties (left) differ from ties between principal means (right). Hollow markers flag failed validity; NA means a principal point is unavailable. Rank bounds are neither confidence intervals nor calibrated detection probabilities.
